

Adaptive Motivation Assistant (MVP) – PRD

Project Overview

This project builds an AI-powered assistant designed to help users stay consistent with their goals by supporting them through inconsistency rather than punishing it. The system creates a psychologically safe space where users can pause, make mistakes, and return without guilt. Instead of enforcing streaks or rigid discipline, it detects disengagement and responds with adaptive, low-pressure interventions that reduce friction and encourage re-entry.

Level

Medium

Type of Project

AI Development, Behavioral Design, Personal Productivity

Skills Required

JavaScript (React/Node), Mobile-first UI, OpenAI API, Rule-based logic, UX design

Key Features

Milestone 1: Goal to Plan Engine

User inputs a goal and duration. System generates simple daily tasks that are flexible and adjustable.

Milestone 2: Daily Execution Loop

User sees one task daily and can mark Done, Skip, or Too Much. System tracks behavior.

Milestone 3: Drop-off Detection

System detects missed tasks, inactivity, and resistance signals. Users move across states: On Track, Drifting, Disengaging, At Risk, Returning.

Milestone 4: Adaptive Intervention

System reduces task difficulty, removes pressure, and encourages re-entry when users disengage.

Milestone 5: Motivation System

Messages are supportive, non-judgmental, and reinforce effort and return.

Core Principle

Consistency is about returning, not perfection. Users should feel safe to pause and come back.

MVP Constraints

Single goal, minimal UI, rule-based system, no integrations.

Success Metrics

Return rate after drop-off, recovery time, task completion, retention.
